

# Conclusion

\*Restatement of Thesis

\*Summary of Main points

\*Final Thought

**Directions:** Underline the restatement of the thesis once. Underline the final thought twice.

Many injuries to children can be avoided by good parental supervision, safety checks, and good communication. If parents closely supervised their children at all times, accidents would be less likely to occur. Safety checks to household items could also limit mishaps. And if parents openly discuss safety with their children, youngsters would be more aware of possible dangers. Think of how much you care for your loved ones. If you could do something to protect them and reduce the amount of danger they come across, wouldn't you?

A long time ago, bathing in the United States was rare, considered "high class," and sometimes illegal. Commonly, Americans would go weeks without showering; it was the norm. The only Americans who would bathe were those who could afford to have running water and plumbing in their homes. And if an American was caught "wasting water" and attempting to shower, he or she would face criminal charges. Many things in American society have changed over the past century. Showering becoming more common is a *positive* change in this country.

The use of computers has been linked to birth defects, eye problems, and postural difficulties. A diminutive percentage of American women who have used computers more than 12 hours a day gave birth to children with some sort of physical disability. Furthermore, people who use computers for work or for extended periods of time reported strained or irritated eyes. Lastly, back and other postural problems were reported by people who use computers for their daily work. Computers have majorly advanced technologies, communication, and the world. There has been news, however, that these amazing tools actually aren't all they're cracked up to be.
